EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

1. The application has been amended as follows.

The specification is amended as follows.

The following paragraph is inserted after the title.

This application is the U.S. national phase of International Application No. PCT/AU04/00905, filed on July 2, 2004, which claims priority to Australian Application No. 2003-903412, filed on July 4, 2003.

The claims are amended as follows.

1. (currently amended) A method of identifying a subject predisposed to ischemic stroke, wherein said method comprises:
determining the presence of a mutation in the subject that reduces the release rate from endothelial cells into the circulation of tissue plasminogen activator (t-PA), [[and]] wherein said mutation is a cytosine to thymine mutation at position -7351 of the upstream region of the human tissue plasminogen activator locus, which is position 2228 of SEQ ID NO:1.

Authorization for this Examiner's Amendment was given by telephone by Applicants' agent, Mr. Thomas Siepmann, on July 7, 2008.

2. The following is an examiner's statement of reasons for allowance. The prior art does not teach or suggest the mutation recited in the claims or a method of using this mutation to identify subjects at increased risk for stroke. As previously discussed, Bulens et al. disclose several regions located upstream of the human t-PA gene that are necessary for normal t-PA activity and whose effect can be measured in a CAT assay, in which 9.8 kb of the upstream region of the human t-PA gene are cloned into an expression vector containing the CAT gene and a thymidine kinase promoter. Individual and multiple deletions of various elements in this upstream region are made, and the expression of CAT in all the constructs is compared. One of these regions, an everted element known as ER8, is located between nucleotide positions -7325 and -7535 (see p. 7170 and 7171, left col.), a region that includes the mutation found by Applicants at position -7351. The deletion of this element was found to decrease the expression of CAT two-fold relative to the control (no deletions). One of ordinary skill in the art at the time of the invention would have known that when a polynucleotide region that functions in the activity, presence or expression of a particular protein is deleted, that deletion is likely to result in decreased protein activity or amount when measured in an in vitro assay. One of ordinary skill in the art at the time of the invention also would have known that subjects having a mutation in the genomic area upstream of the t-PA gene would produce less t-PA, or have less t-PA in their blood, and, as a result, would be more likely to suffer from thrombotic disorders such as heart attack and stroke. Further, one of ordinary skill in the art would have known the importance of identifying these individuals at risk for heart attack and stroke as a prophylactic measure. But, the prior art does not disclose Applicants' mutation in the upstream region of the

Art Unit: 1652

human t-PA gene.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Rosanne Kosson whose telephone number is (571)272-2923. The examiner can normally be reached on Monday-Friday, 8:30-6:00, alternate Mondays off.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Nashaat Nashed can be reached on 571-272-0934. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Abstract

The present invention relates to a method of identifying a subject predisposed to ischemic stroke. The method includes the step of identifying a mutation in the subject that reduces the release rate of tissue plasminogen activator.
